

CS314: HW5 Solution, Spring 2014

Problem 1

(*1*): 0, 0, 30

(*2*): 5, 3

(*3*): 0

(*4*): 0, 7

(*5*): 2, 3

(*6*): 2, 0

Problem 2.1

```
program main()
{
  int A , (1,2);
  procedure f()
  {
    int (2,1);
    procedure g()
    {
      int (3,1);
      (3,1)= 30;
      ... = ... (1,2)...//<<<----- (*A*)
      print A,(1,2),(3,1); ) //<<<----- (*1*)
      end g;
    }
    print A,b; //<<<----- (*2*)
    A = 0; (1,2) = 0; (2,1) = 0;
    call g();
    print (2,1); //<<<----- (*3*)
    end f;
  }
  procedure g()
  {
    int A, (2,2);
    A = 5; (2,2) = 7;
    call f();
    print A, (2,2); //<<<----- (*4*)
    end g;
  }

  A= 2; (1,2) = 3
  print A,(1,2); //<<<-----(*5*)
  call g();
  print A , (1,2); //<<<-----(*6*)

  end
}
```

Problem 2.2

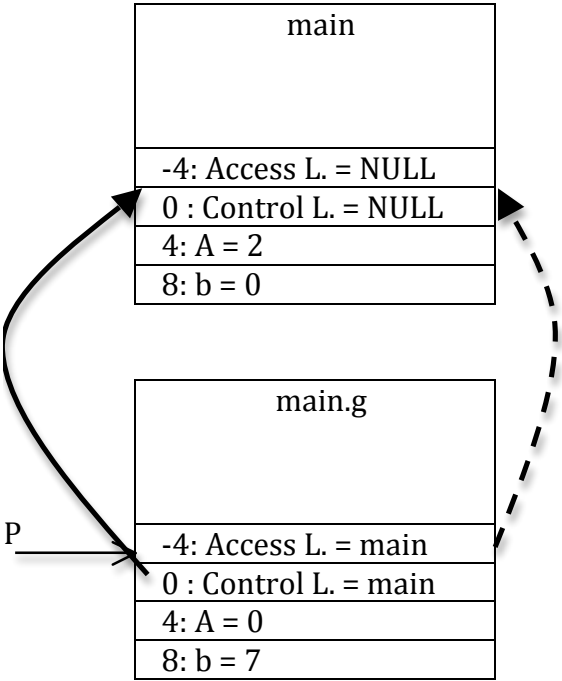

At Point (*1*)

At Point (*3*)

At Point (*4*)

At Point (*6*)

Problem 2.3

Variable “b” is represented by (level, offset) pair (1,2).

Code has to be generated for access to (1,2) at level 3 since main.f.g is at level 3.

LOADI #8 => r1 // offset of variable in bytes from FP

LOADI #-4 => r2 // offset of access link in bytes from FP

ADD r0, r2 => r3 // address of access link in current frame

LOAD r3 => r4 // address of most recent frame at level 2

ADD r4 r2 => r5 // address of access link in level 2 frame

LOAD r5 => r6 // address of most recent frame at level 1

ADD r6 r1 => r7 // address of second local variable in level 1 (main) frame

LOAD r7 => r8 // get content of variable b
